the ice storage tank where it is cooled to the desired temperature and distributed throughout the system. This describes the fundamental thermal ice storage system. There is no limit to the size of the cooling system. However, for small systems (less than 100 tons (352 kW)), thermal ice storage may be economically hard to justify.

And while there have been larger single-site thermal storage projects, such as the molten salt system at the 300 MW Solana Concentrating Solar Power (CSP) plant in Arizona, Ice Energy says that when complete this will be the largest distributed thermal energy storage system in the nation. Ice "batteries"

The latent energy storage in the ice serves as a nearly uniform temperature reservoir for heat rejection from a refrigerant that is used to both charge and discharge the ice tank. During ice charging mode, the refrigerant is circulated between the UTSS-internal compressor and the storage tank in a vapor compression cycle using the ice as the ...

The Ice Bear stores energy by freezing and storing ice during cooler, off-peak hours. During peak hours, it turns off energy-intensive AC compressors and uses the stored ice instead to provide ...

Illustration of an ice storage air conditioning unit in production. Ice storage air conditioning is the process of using ice for thermal energy storage. The process can reduce energy used for cooling during times of peak electrical demand. [1] Alternative power sources such as solar can also use the technology to store energy for later use. [1] This is practical because of water's large heat ...

The basic idea is to use electricity to make ice in coordination with daily usage cycles, when demand is low. The ice can then be used for cooling during periods of high demand, while avoiding additional strain on the grid. Saving money on peak electricity costs was the primary goal of conventional demand-sensitive ice based storage systems.
