A pathway for using lithium in room-temperature rechargeable batteries was established in the early 1970s, upon the discovery that electrochemical intercalation of guest molecules into layered hosts could also be used to store and release energy in battery electrodes. [2]

Manufacturing a kg of Li-ion battery takes about 67 megajoule (MJ) of energy. [253][254] The global warming potential of lithium-ion batteries manufacturing strongly depends on the energy source used in mining and manufacturing operations, and is difficult to estimate, but one 2019 study estimated 73 kg CO₂e/kWh. [255]

Batteries are one of the obvious other solutions for energy storage. For the time being, lithium-ion (li-ion) batteries are the favoured option.
