

Pumped Hydroelectric Storage. Pumped hydroelectric storage facilities store energy in the form of water in an upper reservoir, pumped from another reservoir at a lower elevation. During periods of high electricity demand, power is generated by releasing the stored water through turbines in the same manner as a conventional hydropower station.

Compressed air energy storage (CAES) is also a form of mechanical storage. CAES plants are very similar to pumped-hydro power plants, but instead of pumping water from one reservoir to another, in a compressed air plant, air or another gas is compressed and stored in an underground cavern or pressurized container.

The pumped hydro storage part, shown in Fig. 6.2, initiates when the demand falls short, and the part of the generated electricity is used to pump water from the lower reservoir back into the upper reservoir. Since this operation is allowed to take place for a time duration from six to eight hours (before the demand surges up again the next day), the power used up by the ...
