But intermittency in sectors like wind and solar power -- a disruption caused by the inconsistency of the weather -- has made them less reliable as forms of energy. These limitations, however, have been primarily offset by the use of Battery Energy Storage Systems (BESS), a means of storing the energy produced until it is needed.

E_v = latent volumetric energy storage. E_v^* = volumetric energy storage within 20 °C of T_m ($T_m \pm 10$ °C). This value accounts for the small but significant additional energy stored in the form of sensible heat. We have assumed a specific heat capacity (C_p) value of 1.5 J mol⁻¹ K⁻¹ for the calculation because of the absence of data in the solid and liquid state.
