The storage capacity depends on the size and rotational speed of the flywheel, the latter is more significant since the storage capacity is proportional to the square of the flywheel speed. The use of composite materials allows for faster rotational speeds and higher power densities than equivalent battery energy storage systems.

Another method used in flywheel energy storage systems is to store energy with high speed. In this method the rotating object is rotated up to 100,000 rpm . The rotating object weight is low in this method. This method is used in small applications in terms of volume and weight.

Low-inertia power systems suffer from a high rate of change of frequency (ROCOF) during a sudden imbalance in supply and demand. Inertia emulation techniques using storage systems, such as flywheel energy storage systems (FESSs), can help to reduce the ROCOF by rapidly providing the needed power to balance the grid.

Low speed flywheel energy storage

The minimum speed of the flywheel is typically half its full speed, the storage energy is given by $\frac{1}{2} I \omega^2$ where I is the rotor moment of inertia in kgm^2 and the ω maximum rotational speed in rad/s . The power level is controlled by the size of the M/G, so this is independent of the rotor.

Broadly speaking, the flywheel spinning speed allows classifying FESSs in two types [7]: low-speed FESSs (< 6000 rpm) and high-speed FESSs ($10^4 - 10^5$ rpm). In order to maximize the energy efficiency low-speed FESSs make use of conventional technologies, whereas high-speed FESSs make use of advanced technologies.
