

Among the many energy storage technology options, thermal energy storage (TES) is very promising as more than 90% of the world's primary energy generation is consumed or wasted as heat. TES entails storing energy as either sensible heat through heating of a suitable material, as latent heat in a phase change material (PCM), or the heat of a reversible ...

While TES can store high amounts of energy, the materials used are often expensive, corrosive, and pose health and environmental hazards. TES exploits the latent heat of phase change whilst the storage medium (phase change material or PCM) undergoes a phase transition (solid-solid, solid-liquid, or liquid-gas).
