The electric breakdown strength (E_b) is an important factor that determines the practical applications of dielectric materials in electrical energy storage and electronics. However, there is a tradeoff between E_b and the dielectric constant in the dielectrics, and E_b is typically lower than 10 MV/cm. In this work, ferroelectric thin film (Bi_{0.2}Na_{0.2}K_{0.2}La_{0.2}Sr_{0.2})TiO₃ ...

Clean energy, based on renewable sources such as sunlight and wind, offers a way forward towards a more inhabitable and sustainable world. A hurdle to this, however, is that renewables do not always produce energy when it is needed, and finding storage that is clean and with sufficient capacity is indispensable.

Energy storage systems offer an ideal solution for enhancing the flexibility of energy projects. Designed for both outdoor and indoor use, these systems can be deployed in diverse settings, from remote wind farms to dense urban environments. The modular structure allows for easy customization and expansion, adapting to a wide range of requirements.

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.
