The resulting MoS₂/graphene composite material exhibited excellent cycle stability and ultra-high rate performance as an anode material for LIBs. Specifically, after 250 cycles at a current density of 300 mA/g, the specific discharge capacity remained at 421 mA h/g.

MoS₂ is a semiconducting, photovoltaic, and photocatalytic material with an indirect band gap of ~1.2 eV in the bulk form [1]. As a typical transition metal dichalcogenides (TMDs), MoS₂ possess an analogous structure to graphite. In the crystal structure of MoS₂, each Mo (IV) sits in the center of a triangular prism and is bound to six S atoms; meanwhile, ...

When the MOS tube is connected to the bus and load ground, a high-voltage side switch is used. P-channel MOS tubes are usually used in this topology, which is also for voltage drive considerations. 2. Determine the current rating of the MOS tube. This current rating should be the maximum current that the load can withstand in all cases.

MoS₂ has a reversible sodium storage capacity because of its high layer gap, which makes it easy for Na⁺ to be injected into the layered structure and form the Na⁺ adsorption surface. In order to increase the electronic conductivity of composite material, most studies to date have combined MoS₂ with carbon-based materials.
