

However, the last decade saw an increasing interest in rail vehicles with onboard energy storage systems (OESSs) for improved energy efficiency and potential catenary-free operation. These vehicles can minimize costs by reducing maintenance and installation requirements of the electrified infrastructure.

In the second stage, the speed of the ship, the dispatch of the onboard diesel engine, and the usage of energy storage systems (ESSs) are optimized based on emission control areas and maritime meteorological conditions. Simulation results have shown that the proposed approach would help ship operators minimize the operating cost over the whole ...

OESS, onboard energy storage system **FIGURE 2** Global energy consumption and well-to-wheel CO<sub>2</sub>-equivalent emissions per passenger-kilometre for different means of passenger transport [22]. The bars indicate the ranges of variation observed worldwide, while the blue dots indicate world averages. Energy and emission data are from 2017 and

Cities and transit authorities are procuring hybrid streetcars with onboard energy storage systems (OESSs). The energy storage system needs to be protected from both external and internal ground faults that may transfer to the vehicle. A hybrid streetcar has an OESS consisting of lithium batteries or supercapacitors, with an OESS converter ...

of onboard railway systems with energy storage devices. In-service trains as well as relevant prototypes are presented, and their characteristics are analyzed. A comprehensive study of the traction system structure of these vehicles is introduced providing an overview of all the converter architectures used, categorized based

This paper provides a detailed review of onboard railway systems with energy storage devices. In-service trains as well as relevant prototypes are presented and their characteristics are analyzed ...

The onboard energy storage system (ESS) is highly subject to the fuel economy and all-electric range (AER) of EVs. The energy storage devices are continuously charging and discharging based on the power demands of a vehicle and also act as catalysts to ...

As a result, a high tendency for integrating onboard energy storage systems in trains is being observed worldwide. This article provides a detailed review of onboard railway systems with energy storage devices. In-service trains as well as relevant prototypes are presented, and their characteristics are analyzed.

Cities and transit authorities are procuring hybrid streetcars with onboard energy storage systems (OESSs). The energy storage system needs to be protected from both external and internal ground faults that may transfer to the vehicle. A hybrid streetcar has an OESS consisting of lithium batteries or supercapacitors, with an OESS converter connected to, or ...

saving and investment, this paper proposes the collaborative operation of Onboard Energy-Storage Systems (OESS) and Stationary Energy-Storage Systems (SESS). In the meantime, Non-dominated Sorting Genetic Algorithm-II (NSGA-II) is applied to optimize the ESS capacity and reduce its re-dundancy. The simulation is programmed in MATLAB.

This simulation tool is used to study the most convenient ESS alternative for the case of a Brussels metro line. When compared with a conventional metro line, the total energy consumption reduction achieved with stationary ESS varies in function of the traffic conditions, ESS size, and ESS distribution along the line.

The energy storage hence requires to be recharged in short time per trip and should be functional for approximately 20 years. According to techno-economic criteria, supercapacitor-based energy storage appears a compromise solution, whilst batteries appear limited lifetime storage and flywheels raise issues on the plug-in integration.

**Abstract:** An onboard energy storage system (OESS) with fast-energy-exchange capability is needed to enable future grid-to-vehicle (G2V) and vehicle-to-grid (V2G) operations. To ...

Useful constants: 0.2778 kWh/MJ; Lower heating value for H<sub>2</sub> is 33.3 kWh/kg H<sub>2</sub>; 1 kg H<sub>2</sub> ≈ 1 gal gasoline equivalent (gge) on energy basis.. a For a normalized comparison of system performance to the targets, a usable H<sub>2</sub> storage capacity of 5.6 kg H<sub>2</sub> should be used at the lower heating value of hydrogen (33.3 kWh/kg H<sub>2</sub>). Targets are for a complete system, ...

A relevant number of urban and regional rail vehicles with onboard batteries are in operation in Europe, America, and Asia at this time. Practical use of such storage devices has shown that energy savings, line voltage stabilization, and catenary-free operation can be effectively achieved .

This article provides a detailed review of onboard railway systems with energy storage devices. In-service trains as well as relevant prototypes are presented, and their characteristics are ...

Another aspect that should be looked into to achieve an optimal selection, dimensioning, and management of energy storage systems is the perspective of economic generation and utilisation of electricity for onboard power systems. One of the proposed methods was presented in .

The wayside energy storage system has been widely used in the subway, but it cannot solve the "regeneration failure" problem. Therefore, an implement using onboard energy storage system to replace onboard braking resistor is proposed, which has the potential to eliminate the "regeneration failure" problem. This paper proposes a coordinated energy management ...

The most commonly used ESS for onboard utility are battery energy storage systems (BESS) and hybrid energy storage systems (HESS) based on fuel cells (FC) [12, 13, 14]. Modern BESS for onboard utility can be classicized into two groups of batteries: lead-acid and Lithium-Ion (Li-Ion).

these drives, e.g., diesel with additional, heat recovery systems and energy storage system (ESS) on all new vessels as well as vessels currently undergoing modernisation [3,11,12]. The most commonly used ESS for onboard utility are battery energy storage systems (BESS) and hybrid energy storage systems (HESS) based on fuel cells (FC) [12-14].

It is applicable to high and low voltage, AC and DC power systems, and can be combined with a variety of energy sources such as diesel or gas engines and fuel cells. The system can be integrated as an all-electric or a hybrid power system. Benefit from increased safety, flexibility and efficiency by installing energy storage onboard.

[3,11,12]. The most commonly used ESS for onboard utility are battery energy storage systems (BESS) and hybrid energy storage systems (HESS) based on fuel cells (FC) [12-14]. Modern BESS for onboard utility can be classicized into two groups of batteries: lead-acid and Lithium-Ion (Li-Ion). Lead-acid batteries have been used as BESS on ves-

An alternative is catenary free trams, driven by on-board energy storage system. Various energy storage solutions and trackside power delivery technologies are explained in [4], [5]. Lithium-ion ...

Nowadays, friendly urban-adapted railway vehicles are required, in this matter, manufacturers are committed to develop more efficient and cost-competitive mobility solutions. The search of the most competitive solution takes on high importance when the Onboard Energy Storage Systems (OESSs) become part of the project equation due to the additional cost they represent over a ...

Energy storage system (ESS) is a critical component in all-electric ships (AESs). However, an improper size and management of energy storage system will deteriorate the technical and economic performance of the shipboard microgrids. In this paper, a joint optimization scheme is developed for ESS sizing and optimal power management for the whole shipboard power ...

1.2 Railway Energy Storage Systems. Ideally, the most effective way to increase the global efficiency of traction systems is to use the regenerative braking energy to feed another train in traction mode (and absorbing the totality of the braking energy) []. However, this solution requires an excellent synchronism and a small distance between "in traction mode" and "in ...

For improving the energy efficiency of railway systems, onboard energy storage devices (OESDs) have been applied to assist the traction and recover the regenerative energy. This article aims to address the optimal sizing problem of OESDs to minimize the catenary energy consumption for practical train operations. By employing a mixed-integer linear programming ...

Moreover, the maturity and potential of recent technologies and alternative topologies of power converters for multimodal traction systems are discussed. Ultimately, onboard storage systems are compared with other

# Onboard energy storage system

solutions for energy-saving and catenary-free operation, with particular focus on their current techno-economic attractiveness as an ...

Hybridization of rolling stock vehicles with onboard energy storage systems in AC and DC electrification system is a realistic future trend that will transform the railway industry. In this emerging market even nowadays there are challenges related to the optimization of the storage system and its design, with the goal of minimizing TCO and fulfilling current international ...

**Abstract:** With the rapid development of energy storage technology, onboard energy storage systems (OESS) have been applied in modern railway systems to help reduce energy consumption.
