

Energy storage is one of the key factors to ensure energy safety and net-zero greenhouse gas emissions by the year 2050 [1]. Although global energy demand will rise due to the economic development and the population increase, the ambitious aim to reduce greenhouse gas emissions is pushing towards a severe change in the employed energy systems through ...

Thermal energy storage using organic Phase Change Material (PCM) can play an important role in effective thermal management of the building. Organic PCM are widely utilized to regulate the indoor thermal environment of the building because of good chemical and thermal stability, high heat of fusion, and large availability in the required temperature range.

This work reports a facile approach for rapid and efficient charging of thermal energy storage materials by the instant and intense photothermal effect of uniformly distributed ...

The energy content and thermal stability of C in the bulk soil, in free and occluded particulate organic matter (fPOM and oPOM), and in mineral-associated organic matter (MAOM) were analysed by thermogravimetry and differential scanning calorimetry as proxies for S available for microbial decomposition.

Many organic PCMs are attractive substances owing to their low cost, high LHS capacity, suitable phase change temperatures and several advantageous physicochemical and thermal properties such as non-toxicity, non-corrosion, high chemical stability and thermal durability [[4], [5], [6], [7]]. However, some characteristics can be drawbacks for some specific ...

A transcritical CO<sub>2</sub> cycle is also an alternative for solar energy utilization if a low temperature heat sink is available. Mehrpooya and Sharifzadeh [8] proposed a novel oxy-fuel transcritical Rankine cycle with carbon capture for the simultaneous utilization of solar energy and liquefied natural gas (LNG) cold energy. A thermal energy storage tank was adopted to ...

Energy storage and conversion are vital for addressing global energy challenges, particularly the demand for clean and sustainable energy. Functional organic materials are gaining interest as efficient candidates for these systems due to their abundant resources, tunability, low cost, and environmental friendliness. This review is conducted to address the limitations and challenges ...

Energy storage and conversion are vital for addressing global energy challenges, particularly the demand for clean and sustainable energy. Functional organic materials are gaining interest as ...

For example, Parameshwaran et al. [12] studied the thermal properties of organic esters PCM with silver-titanium nanoparticles in the range of 0.1 % to 1.5 %. Song et al. [13] ... Thermal energy storage is actively performed using PCMs. PCM stores thermal energy actively with change in phase and releases back as per the designated application.

Phase change materials (PCMs) are an integral part of the LTES system and directly influence its effectiveness. By changing phases, PCMs can take in and later release great quantities of energy [12]. PCMs are classified as organic, inorganic, and eutectic, with the organic group being the most widely used, as they are easily available, safe, and have low ...

The research on phase change materials (PCMs) for thermal energy storage systems has been gaining momentum in a quest to identify better materials with low-cost, ease of availability, improved thermal and chemical stabilities and eco-friendly nature. The present article comprehensively reviews the novel PCMs and their synthesis and characterization techniques ...

Thus, this study proposes an integrated AA-CAES system incorporating high-temperature thermal energy storage and an Organic Rankine Cycle (ORC). The high-temperature thermal energy storage is introduced to heat the discharging compressed air to enhance the air turbine performance, and the Organic Rankine Cycle is integrated to utilize the waste ...

This work introduces two new thermally integrated pumped thermal energy storage (TIPTES) systems, including thermally integrated vapor compression heat pump (TIHP) as a charging cycle and dual-pressure organic Rankine cycle (DPORC) and dual-loop organic Rankine cycle (DLORC) as discharging cycles to investigate their capability of improving ...

Moreover, PCM microcapsules still have other potential applications such as solar-to-thermal energy storage, electrical-to-thermal energy storage, and biomedicine . Zhang et al. studied solar-driven PCM microcapsules with efficient Ti ...

Thermal energy storage (TES) techniques are classified into thermochemical energy storage, sensible heat storage, and latent heat storage (LHS). ... researched the influences of interfacial interactions between N-doped hierarchical carbon and different small molecular organic PCMs on the thermal storage performance. In situ N-doped 3D nanoscale ...

ATES is a promising alternative to the traditional compression method of thermal storage such as sensible and latent heat storage. In ATES, the heat from a working fluid source such as water, methanol, ethanol and ammonia is absorbed by an adsorbent through an endothermic process and released through an exothermic process [3], [4], [5] general, latent ...

Fatty alcohols have been identified as promising organic phase change materials (PCMs) for thermal energy storage, because of their suitable temperature range, nontoxicity and can be obtained from ...

From the huge unexplored potential of non-paraffin organic compounds with exceptional thermal energy storage characteristics, this study identifies two novel eutectic PCM of margaric acid-behenic acid (MB) and palmitic acid-behenic acid (PB) with a melting temperature of 62.47 °C and 62.62 °C with high

melting enthalpies of 170.66 J g<sup>-1</sup> and 188.86 J g<sup>-1</sup>, ...

Thermal energy storage (TES) can be achieved by cooling, heating, melting, solidifying, or vaporizing a material with the energy becoming available as heat when the process is reversed. ... DSC results revealed that up to 30 wt.% of the esters could be absorbed so forming composite inorganic-organic PCMs. The thermal properties of ethylene ...

Inorganic PCMs are cheaper than organic and have high thermal energy storage capacity [31,32,33]. On the contrary, esters, fatty acids, and blends as natural stage change materials have likewise been prescribed because of their alluring warm and heat transfer qualities with points of interest of its simple impregnation, or straightforwardly ...

China is committed to the targets of achieving peak CO<sub>2</sub> emissions around 2030 and realizing carbon neutrality around 2060. To realize carbon neutrality, people are seeking to replace fossil fuel with renewable energy. Thermal energy storage is the key to overcoming the intermittence and fluctuation of renewable energy utilization. In this paper, the relation between ...

Thermal energy storage (TES) ... Table 1 concludes that organic PCMs have minimum thermal conductivity and low latent heat of fusion compared to inorganic and eutectic-type PCMs. However, from an environmental standpoint, some organic PCMs are biodegradable, unlike the other two types. Consequently, researchers are investigating alternative ...

Organic PCM additionally hinder more time for energy storage and release due to the lack of thermal networks which causes the heating source (solar power or waste heat recovery in case of renewable energy & electric power in case of conventional source) to operate for a prolonged duration to charge the PCM, consequently resulting in more energy ...

The energy storage in the form of latent heat energy is better than the sensible energy storage in terms of operating temperature and storage density. Organic PCMs (O-PCMs) have great potential, especially from low to medium temperature-TES applications due to their several admirable thermal and physical characteristics.

Organic shape-stabilized solar thermal energy storage materials (OCSPCMs) with broadband harvesting for visible light were obtained by crosslinking and color matching, which provided a new platform for improving the efficiency of solar radiation utilization. [Download](#): [Download high-res image \(67KB\)](#) [Download](#): [Download full-size image](#)

Thermal energy storage (TES) based on organic phase change materials (OPCMs) is an advanced material. They are widely developed for various applications especially for thermal comfort building, solar heating system, thermal protection, air-conditioning, transportation, thermal regulated textiles, electronic devices, etc. OPCMs are more preferred to ...

Organic Phase Change (PCM) constituents referred as an essential latent heat energy storage resource and also an applicable candidate in a variety of fields such as thermal protection, thermal energy storage and heat transfer fluid [82], [114]. Due to its low thermal conductivity, its uses are restricted.

Efficient storage of thermal energy can be greatly enhanced by the use of phase change materials (PCMs). The selection or development of a useful PCM requires careful consideration of many physical and chemical properties. In this review of our recent studies of PCMs, we show that linking the molecular struc

Similarly, thermal energy storage is an important component to couple the charging and discharging cycle, and the heat transfer performance of thermal energy storage should be comprehensively studied and evaluated. ... Reversible heat pump-organic rankine cycle systems for the storage of renewable electricity. Energies, 11 (2018) Google ...

Fatty alcohols have been identified as promising organic phase change materials (PCMs) for thermal energy storage, because of their suitable temperature range, nontoxicity ...

Fig. 1 (a) and (b) show that partial evaporation may occur if the thermal power or thermal parameters (i.e., insufficient, and floating mass flow rate and/or too low temperature) of intermittent heat source are too low to evaporate the organic working fluid. In that case, the flashing or expansion process proceeds in wet vapour conditions and vapour quality may vary ...
