The materials used for latent heat thermal energy storage (LHTES) are called Phase Change Materials (PCMs) [19]. PCMs are a group of materials that have an intrinsic capability of absorbing and releasing heat during

phase transition cycles, which results in the charging and discharging [20].

As a well-known latent heat storage material, PCMs realize the storage and release of thermal energy during phase change process [15]. Because of their temperature within a certain range, PCMs are widely used in building energy conservation, electronic components, and lithium-ion batteries [16, 17].
