A flywheel is an inertial energy storage device. It absorbs mechanical energy and serves as a reservoir, storing energy during the period when the supply of energy is more than the requirement and releases it during the period when required and releases it during the period when the requirement of energy is more than the supply.

Rotor Design for High-Speed Flywheel Energy Storage Systems 5 Fig. 4. Schematic showing power flow in FES system r_i and r_o and a height of h , a further expression for the kinetic energy stored in the rotor can be determined as $E_{kin} = \frac{1}{2} \rho \pi h (r_o^4 - r_i^4) \omega^2$. (2) From the above equation it can be deduced that the kinetic energy of the rotor increases

Considering the aspects discussed in Sect. 2.2.1, it becomes clear that the maximum energy content of a flywheel energy storage device is defined by the permissible rotor speed. This speed in turn is limited by design factors and material properties. If conventional roller bearings are used, these often limit the speed, as do the heat losses of the electrical machine, ...
