The problem with VCM on 2nd gens is oil consumption. When VCM is active, the dormant cylinders cause excess engine oil to be pump up into the combustion chamber where it burns and causes stuck rings and carbon buildup on valves. Burned oil deposits end up in the EGR system and catalytic converters.

Through the individual and collective efforts of the aviation community, the FAA hopes to eliminate factors that have caused engine power-loss accidents. This AC is one of many efforts to try to reduce the "power-loss" type of accidents. The simple act of "keeping the engine running" could appreciably reduce the number of accidents.

Underground water-sealed oil storage caverns play a crucial role in the energy reserve systems of countries worldwide due to their high safety and economic benefits [1][2][3][4][5].
