Capacity defines the energy stored in the system and depends on the storage process, the medium and the size of the system;. Power defines how fast the energy stored in the system can be discharged (and charged);. Efficiency is the ratio of the energy provided to the user to the energy needed to charge the storage system. It accounts for the energy loss during the ...

In this case, the fluid is released from its high-pressure storage and into a rotational energy extraction machine (an air turbine) that would convert the kinetic energy of the fluid into rotational mechanical energy in a wheel that is engaged with an electrical generator and then back into the grid, as shown in Fig. 7.1b.
