mechanical work, including forms of energy storage that can be introduced as secondary power sources or regenerative intermediate storage systems.

These systems consist of several major components: collectors, a storage tank, a heat exchanger, a controller system, and a backup heater. In a solar hot water system, there"s no movement of electrons, and no creation of electricity. Instead, the solar panels, known as "collectors," transform solar energy into heat.

Flywheel Energy Storage Systems (FESS) work by storing energy in the form of kinetic energy within a rotating mass, known as a flywheel. Here's the working principle explained in simple way, Energy Storage: The system features a flywheel made from a carbon fiber composite, which is both durable and capable of storing a lot of energy.
