FESS has a unique advantage over other energy storage technologies: It can provide a second function while serving as an energy storage device. Earlier works use flywheels as satellite attitude-control devices. A review of flywheel attitude control and energy storage for aerospace is given in [159].

Wind and photovoltaic generation systems are expected to become some of the main driving technologies toward the decarbonization target [1,2,3]. Globally operating power grid systems struggle to handle the large-scale interaction of such variable energy sources which could lead to all kinds of disruptions, compromising service continuity.

While non-battery energy storage technologies (e.g., pumped hydroelectric energy storage) are already in widespread use, and other technologies (e.g., gravity-based mechanical storage) are in development, batteries are and will likely continue to be the primary new electric energy storage technology for the next several decades.

Purpose of establishing the energy storage major

The battery energy storage system can be applied to store the energy produced by RESs and then utilized regularly and within limits as necessary to lessen the impact of the intermittent nature of renewable energy sources. The main purpose of the review paper is to present the current state of the art of battery energy storage systems and ...
