After TiO₂ and ZnO-based composites, SnO₂ now plays an important role in photocatalysis. However, the efficiency of SnO₂ is poor because of strong electron-hole pair recombination and low surface activation sites for the redox process. Furthermore, SnO₂ has a large bandgap energy (3.36 eV) and is more active in UV light, but it is ineffective in visible ...

At around USD 325 billion, today's aggregate market value of key energy transition minerals aligns broadly with that of iron ore.

BaTiO₃ ceramics are difficult to withstand high electric fields, so the energy storage density is relatively low, inhabiting their applications for miniaturized and lightweight power electronic devices. To address this issue, we added Sr_{0.7}Bi_{0.2}TiO₃ (SBT) into BaTiO₃ (BT) to destroy the long-range ferroelectric domains. Ca²⁺ was introduced into BT-SBT in the ...
