Generally, SOH describes the health of a battery in terms of its ability to release coulombs. While energy efficiency describes the efficiency of a battery as an energy storage medium in terms of the ratio of energy transfer during charging and discharging. Further details on typical energy efficiency and SOH values can be found in Table 3.

Lithium secondary batteries store 150-250 watt-hours per kilogram (kg) and can store 1.5-2 times more energy than Na-S batteries, two to three times more than redox flow batteries, and about five times more than lead storage batteries. Charge and discharge efficiency is a performance scale that can be used to assess battery efficiency.

Lithium-ion Batteries. Over recent years, Lithium-ion batteries have rushed in popularity. Li-ion batteries are most commonly used in electric light motor vehicles because of their high power-to-weight ratio, good high-temperature performance, excellent specific energy, and low self-discharge rate.
