H. El-Hefnawi}, journal={Applied Energy}, year={1990}, volume={35}, pages={177-188}, ...

The full solar spectrum was directed to the PV cell with the thermal system acting as a heat sink. A numerical optimization concluded that the CPV-ORC combination improved the efficiency of CPV technology from 9.81% to 11.83% [14]. ... The cold co mirror was a dichroic spectrally selective mirror withh the dichroic film by Evaporated Metal ...

In this paper, full-spectrum selective thin film based photonic cooler is proposed for passively cooling solar cells of the space solar power station via orb-shape membrane energy gathering array concept (SSPS-OMEGA). The photonic cooler is designed and made of periodic one-dimensional photonic crystal that can reflect solar radiation ...

Nanostructured surface, a promising photon management strategy, enables to enhance photon-to-heat conversion efficiency by manipulating spectral radiative properties ranging from solar spectrum (0.3-2.5 μm) to mid-infrared spectrum (2.5-20 μm). Here, a core-shell nanocone structured surface made of silica core and tungsten shell as a solar ...

Current TPV advancements are focused on improving both transparency and power output to rival commercially available silicon solar panels. In this review, we first briefly ...

1. Introduction. For decades, solar cell efficiencies have been maintained below the thermodynamic limits [1]. So far, the efficiency of single-junction solar cells is still lower than 30 %, leaving a large fraction (greater than 70 %) of radiation wasted [2]. The photovoltaic (PV) effect determines that only part of the incident photons in a specific spectrum band can generate ...

Concept of the selective solar harvesting (SSH) window. a) lass-encrusted high-rise buildings. b) Schematic of the SSH window showing the transparent photovoltaic (TPV), transparent solar ...

By controlling the film thickness and donor-acceptor ratio, the average visible transmission (AVT) of TPVs can be precisely managed in the range of 40% - 85%, and the ...

The primary aim of the research is to improve photovoltaic thermal systems, with a particular focus on enhancing their efficiency and overall effectiveness by utilizing the Fresnel lens and nanofluid-based liquid spectrum filter with a dual-axis solar tracker. The study explores innovative techniques, including the application of nanofluid to cool the solar panel. This ...

The SBS-based PVT systems are classified on the basis of optical filters employed for splitting the solar spectrum. The selective spectrum splitting using (1) semi-transparent PV cell, (2) nano ...

2.1. PV module design, experimental box and light measurement We opted for mature thin-film Si technology (30,31) to design and fabricate spectrally selective PV pseudo-modules, hereafter referred to as PV films or filters due to their function as light filters for plants. Although electrically non-functional, these pseudo-

DOI: 10.1016/j.actaastro.2020.12.035 Corpus ID: 233806502; Full-spectrum selective thin film based photonic cooler for solar cells of space solar power station @article{Fan2021FullspectrumST, title={Full-spectrum selective thin film based photonic cooler for solar cells of space solar power station}, author={Guanheng Fan and Bao-yan Duan and ...

The ever-growing field of photovoltaics has witnessed the rapid success of halide perovskites in achieving a high power conversion efficiency (PCE) over 25% 1,2.Perovskite solar cells (PSCs ...

photovoltaic/thermal (PV/T) collector and a hybrid "solar window", are presented and analyzed to evaluate technical performance. In both concepts, a wavelength selective film is coupled with a compound parabolic concentrator (CPC) to reflect and concentrate the infrared portion of the solar spectrum onto a tubular absorber.

Furthermore, there is a need to undertake more detailed experimental trials to fine-tune the modulation of light passing through selective PV films. While our PV selective film design was based on the absorption spectrum of *A. thaliana*, a model species in plant science, the PV selective film layers' transmittance could be optimized encompassing ...

We have presented a comprehensive review of the recent advances in solar selective absorbers for solar-thermal energy conversion and IR selective emitters for passive radiative cooling, as ...

The full solar spectrum was directed to the PV cell with the thermal system acting as a heat sink. A numerical optimization concluded that the CPV-ORC combination improved the efficiency of CPV technology from 9.81% to 11.83% [14]. ... The cold col mirror was a dichroic spectrally selective mirror withh the dichroic d film by Evaporated Metal ...

With the increasing development of photothermal techniques in various fields, particularly concentrated solar power (CSP) systems and solar thermoelectric generators (STEGs), the demand for high-performance ...

Herein, a dual-band selective solar harvesting (SSH) window is developed to realize full-spectrum utilization. A transparent photovoltaic, converting ultraviolet into electricity, and a transparent solar absorber, converting near-infrared into thermal energy, are integrated and coupled with a ventilation system to extract heat for

indoor use.

Compared with opaque photovoltaics, transparent photovoltaic (TPV) techniques can not only convert solar energy into electricity but also provide a natural visible-light environment, which offers ...

control typical opaque PV modules to best adapt them for use agrivoltaic systems. A second in approach is to develop module level technologies that are semi-transparent or otherwise spectrally selective. This approach seeks to modify the PV surface to best access the light from the solar spectrum that is in excess of crop requirements.

Organic solar cells (OSCs), which enable the expansion of the application areas of photovoltaic technology, have gained significant prominence in science and industry due to ...

The application of spectrally selective PV films appears particularly suitable for microalgal species requiring protection from excessive sunlight, where the modules can harvest surplus energy for electricity production.

Request PDF | On Sep 1, 2024, Silvia Ma Lu and others published Wavelength-selective solar photovoltaic systems to enhance spectral sharing of sunlight in agrivoltaics | Find, read and cite all ...

Microalgal photosynthesis is a promising solar energy conversion process to produce high concentration biomass, which can be utilized in the various fields including bioenergy, food resources, and ...

To maximize the utilization of solar energy, this study focuses on the investigation of a realistic performance of a photovoltaic/concentrated solar power hybrid using a developed ...

Non-wavelength-selective technologies produce electricity from broad absorption of the solar spectrum (including visible photons) and achieve some AVT by either segmenting opaque PV cells (Fig. 1b ...

Solar photovoltaic (PV) technology has undergone rapid advancement over the past few decades due to its low cost and high flexibility in electricity generation, offering a solution to the energy crisis [1]. Bifacial PV (bPV) technology enhances solar energy utilization by incorporating back contacts instead of a back surface field, allowing for sunlight absorption ...

The ability of photovoltaic devices to harvest solar energy can be enhanced by tailoring the spectrum of incident light with thermophotovoltaic devices. Bierman et al. now show that one such ...
