A solar water heater is typically comprised of solar collectors which absorb solar energy, and a system to transfer the heat to the water. There are two main types of solar water heaters: passive systems, which rely on natural convection to move heated water, and active systems, which use pumps for circulation.

Overview: The Importance of Solar Energy Storage. Solar energy can be stored primarily in two ways: thermal storage and battery storage. Thermal storage involves capturing and storing the sun's heat, while battery storage involves storing power generated by solar panels in batteries for later use.

The fluid is stored in two tanks--one at high temperature and the other at low temperature. Fluid from the low-temperature tank flows through the solar collector or receiver, where solar energy heats it to a high temperature, and it then flows to the high-temperature tank for storage.
