Danish pit thermal energy storage systems have embankments around the edges to dump the soil from the pit and to keep the basin above groundwater. The surrounding walls are at an angle to prevent soil from sliding down, and a floating insulation covers the basin (see fig. 1). Figure 1: Typical Danish PTES design Chart: AEE INTEC

Design of the storage The principal structure of a pit heat storage is quite simple, as it consists of an excavation in the ground covered with a watertight liner. Figure 1. Pit thermal energy storage systems for solar district heating. A large share of around 50% of the total energy demand in Europe is used for heating and cooling purposes (HRE 2019). As more than three-quarters of this demand is met by non-renewable energy sources, this sector is a large contributor to the production of greenhouse gas emissions (Eurostat 2022).
