2.2 Solar Heat Collection and Inter-Seasonal Energy System The SGCHPSS system combined solar hot water system, solar inter-seasonal heat storage and GCHP systematically. To make full use of solar energy and underground energy, the solar inter-seasonal heat storage in summer through underground heat exchanger was designed to be integrated

Inter-Seasonal Heat Storage Ron Tolmie Sustainability-Journal.ca Ottawa, Canada tolmie129@rogers Abstract--Summer heat is potentially one of the largest energy sources in many countries but to be useful it needs to be stored until the winter, preferably without the need for expensive and inflexible district heating systems.

Hence, heat storage systems based on sorption processes present the advantage of having: a large range of operating temperatures, depending on the chosen working pair; a larger heat storage ...

The results show that : under the same ultrasonic (28KHz)frequency, after applying power of 50W?100W and 120W ultrasonic fields on one side of the heat storage device, the heat storage ...

Seasonal thermal energy storage (STES) holds great promise for storing summer heat for winter use. ... Two gas boilers with capacities of 750 and 900 kW th were integrated as back-up heating devices in case of insufficient solar thermal energy available. A solar fraction between 21% and 30% was obtained during 1997-2004. In 2004, another ...

The fundamentals of sorption and reaction-based TCES can be applied to an inter-seasonal heat storage application for storing low- and medium-temperature heat. TCES systems have a potential to develop the cost effective systems in the area of district heating, domestic water heating, and thermal comfort, as well as for space cooling [62] .

This requires the use of solar energy as the thermal energy source, and a solid-liquid phase change material as an inter-seasonal energy storage medium. A design optimisation study was thereafter carried forward to showcase the capability of such a system for a semi-detached house in London, United Kingdom.

The avoided emissions by switching from a natural gas boiler to a latent heat storage system amounts to 2039.83kgCO₂e annually for this case study. It is important to note that the savings in emissions with a solar thermal LHS storage scheme can be realised now as these are independent of the decarbonisation of the electricity network.
