Hybrid supercapacitors combine battery-like and capacitor-like electrodes in a single cell, integrating both faradaic and non-faradaic energy storage mechanisms to achieve enhanced energy and power densities [190]. These systems typically employ a polarizable electrode (e.g., carbon) and a non-polarizable electrode (e.g., metal or conductive ...

Supercapacitors are mainly composed of electrodes, electrolytes, and membrane. According to different electrode materials, supercapacitors can be divided into electric double layer capacitors (EDLCs), psuedocapacitors, and hybrid capacitors. EDLCs mainly store energy by adsorbing electrostatic charges on the electrode surface (non-faradaic).
