Superconducting magnetic energy storage (SMES) and supercapacitors are used in Automotive & Transportation, portable electronics and telecommunication applications, but with different characteristics such as fast charging and long life span for Super capacitors and high power output for SMES, along with low energy density and high cost for both.

Because storage technologies will have the ability to substitute for or complement essentially all other elements of a power system, including generation, transmission, and demand response, these tools will be critical to electricity system designers, operators, and regulators in the future.

Here, the authors optimize TENG and switch configurations to improve energy conversion efficiency and design a TENG-based power supply with energy storage and output regulation functionalities.

Twenty years ago, US production of natural gas -- or methane -- had peaked. Or so we thought. Until hydraulic fracturing made gas abundant, which made it cheap. But some are alarmed by fracking. Though gas has lower carbon emissions, it's still not carbon free. And leaks of methane, a more potent but shorter-lived greenhouse gas, threaten to undo its climate advantages. So ...
