It's important to consider the solar panel arrays'' maximum power output and select an inverter with the correct size, model, and type in order to avoid excessive clipping. It's normal for the DC system size to be about 1.2x greater than the inverter system''s max AC power rating.

A solid state power inverter can in principle be programmed to act as either a synchronous or an asynchronous generator. However, the battery and the solid state switching devices required to properly simulate the behaviour of a synchronous generator with a flywheel are so large and expensive that this simulation capability is seldom used.

A solar inverter feeds power back to the grid by converting the DC current generated by the solar panels into AC current that is synchronized with the grid"s voltage and frequency. This allows the electricity produced by the solar panels to be directly used by electrical appliances in the building and any excess power is sent back to the grid.
