The reason that the emissions of the poor are low is that they lack access to modern energy and technology. The energy problem of the poorer half of the world is energy poverty. The two charts below show that large shares of people in countries with a GDP per capita of less than \$25,000 do not have access to electricity and clean cooking fuels. 2

Business risks associated with poor data quality. To estimate the impact of poor data quality on a business, you need to identify the role data plays in various business processes. This will help you highlight which processes are bound to mess up and cause delays if the data had any of the issues mentioned above.
