The obesity epidemic is often attributed to the "obesogenic" modern environment, which imposes a wide range of barriers to maintaining a healthy weight. 13,14 A growing body of evidence highlights the substantial influence of environmental factors on energy intake and energy expenditure that promote positive energy balance.

This introduces a second question, of course, as to why our energy intake is continuously and inexorably rising. Like the notion that the obesity epidemic is caused by overeating, the explanation for this overeating is also considered axiomatic: the food environment is driving excess intake, owing to intensive marketing of
