The nitrogen depletion stress is widely used to promote energy storage compound (ESC) production of microalgae, such as starch and lipids. Our cultivation results and most reports show that during the nitrogen depletion, the fast ESC's accumulation happens around the overall nitrogen content lowered to the half of normal cells. It indicates that the cells ...

Bioavailable nitrogen (N) in ecological systems is often limited (1-3). Nitrogen-fixing plants are able to overcome this limitation, even in nutrient-poor soils, because they form a symbiosis with diazotrophic bacteria that fix N from the atmosphere (4, 5). These N-fixing plants can thus enrich the surrounding soil and modify the available niche space for other organisms, ...
