As a result, battery storage is becoming more and more competitive with conventional energy sources. It is anticipated that by 2040, the world's energy storage capacity will have increased from a base of 9 GWh in 2018 to over 1095 GWh, demonstrating the vital role that storage will play in the energy transition [29].

Storage plays a crucial role in energy systems by providing both upward and downward flexibility. It can store energy either when there is generation surplus or lower demand and discharge in the opposite case. Depending on the time scale (milliseconds up to months), there are different roles that storage can play in energy systems.

The recent IEC white paper on Electrical Energy Storage presented that energy storage has played three main roles. First, it reduces cost of electricity costs by storing electricity during off-peak times for use at peak times. Secondly, it improves the reliability of the power supply by supporting the users during power interruptions. Thirdly, it improves power quality, ...
