The electrical components rely on the battery when the engine is off. The start-stop system can shut down the engine or keep it running depending on power needs. For example, the system may fail to turn off the engine if the battery is dead or the electrical parts require more power than the battery can supply.

VW dusted off the old 8-valve 2.0-liter engine, which wheezes out only 115 horsepower, and sent it back down the warpath. It may sound pathetic, but in real-world driving, it's not that bad at all; 122 pound-feet of torque are available low in the engine's rev range, which makes up beautifully for the modest power output.

Vw engine on due to system power needs

I have TAOS with the same problems. EPC sign goes on and the engine loses power. Also, the auto stop-start goes on and off itself. Immediately after EPC sign goes on, and the engine stops, I must restart it by turnig off and than on!? Manually, of course! I was at VW service and was told that I should drive longer and the problem would be solved.

Volkswagen says that the problem has been fixed with a software update and that anyone still experiencing issues may have an unrelated mechanical problem. If you are looking at cars with this engine it would be worth checking with the current owner to see if the software update has been applied and also conducting a thorough test drive from cold.
