A reversible water-based electrostatic adhesive has been developed through conventional emulsion polymerization using commodity materials. It is made of two formulations, one containing a polycation, and other a polyanion. Detachment is only promoted in highly acidic or alkaline solutions as polyelectrolytes show distinctive charged states.

With direct adhesion to low surface energy, our water-based adhesives require less surface preparation and fewer products compared to other technologies. **FEATURED PRODUCT: AQUAGRIP 3720.**

In general, the robust adhesion on the electrolyte/electrode interface enables to prevent detachment, reduce interfacial resistances and accelerate uniform ion transport, thus enhancing the electrochemical performance of the solid-state energy storage system [10, 18].

Water-based adhesives are supplied as pre-mixed solutions, or are formulated as dry powders, which producers and distributors must then mix with water in order to obtain its adhesive properties. These properties are obtained when water is either lost from the glue line by evaporation or is absorbed by the substrate.

From Paper Converting, E-Commerce, Tissue and towel, and Labelling, to Furniture, PSA applications for Tapes and Medical applications, and more - our unique and high-quality AQUENCE adhesive portfolio is designed with innovative technology to improve application efficiencies, reduce waste, and provide sustainable solutions.

Here we demonstrate the use of this material as an electrode binder in a lay-up based manufacturing system to produce structural batteries. While conventional binders for structural batteries exhibit a trade-off between mechanical and electrochemical performance, the waterglass binder is rigid, adhesive, and facilitates ion
