Wind power is a form of energy conversion in which turbines convert the kinetic energy of wind into mechanical or electrical energy that can be used for power. Wind power is considered a form of renewable energy. Modern commercial wind turbines produce electricity by using rotational energy to drive a generator.

Energy storage systems for electricity generation operating in the United States Pumped-storage hydroelectric systems. Pumped-storage hydroelectric (PSH) systems are the oldest and some of the largest (in power and energy capacity) utility-scale ESSs in the United States and most were built in the 1970's. PSH systems in the United States use electricity from electric power grids to ...

Storage devices can save energy in many forms (e.g., chemical, kinetic, or thermal) and convert them back to useful forms of energy like electricity. Although almost all current energy storage capacity is in the form of pumped hydro and the deployment of battery systems is accelerating rapidly, a number of storage technologies are currently in use.

This type of storage system can be used in conjunction with a wind farm, pulling in air and creating a high-pressure system in a series of enormous underground chambers. When wind speeds slow down or demand for electricity increases, the pressurised air is discharged to power turbines or generators. Gravity storage
