Energy Storage. The excess energy from the food we eat is digested and incorporated into adipose tissue, or fat tissue. Most of the energy required by the human body is provided by carbohydrates and lipids; in fact, 30-70% of the energy used during rest comes from fat. As discussed previously, glucose is stored in the body as glycogen.

Energy Storage. If the body already has enough energy to support its functions, the excess glucose is stored as glycogen (the majority of which is stored in the muscle and liver). ... Therefore, the body cannot use proteins to make new cells, repair tissue damage, support our immune system, and perform many other functions. The presence of ...
