By integrating real-world load data from 300 households, including non-controllable loads and solar generation, a model is developed to characterize the community's load profile, incorporating deferrable loads, uninterruptible loads, thermal loads, and energy storage as controllable elements [48]. To maintain a consistent baseline across ...

Referred to as transportable energy storage systems, MESSs are generally vehicle-mounted container battery systems equipped with standard-ized physical interfaces to allow for plug-and-play operation. Their transportation could be powered by a diesel engine or the energy from the batteries themselves.

The primary advantage that mobile energy storage offers over stationary energy storage is flexibility. MESSs can be re-located to respond to changing grid conditions, serving different applications as the needs of the power system evolve. For example, during normal operation, a MESS could support an overloaded substation in the summer
